#### Selecting lines, testers and testcrosses

**Prof. Roberto Fritsche-Neto** 

rfneto@agcenter.lsu.edu

Baton Rouge, Mar 20th, 2023

#### Main method to obtain lines

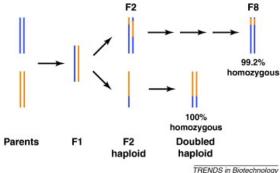

Reestablish the vigor Heterosis

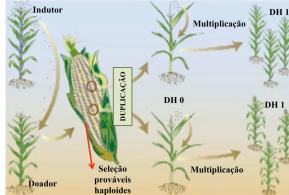

> Single-cross (12,000 Kg / ha)

| Line         |      |      | Among      |           |      |      |      | Within     |           |      |
|--------------|------|------|------------|-----------|------|------|------|------------|-----------|------|
|              | Va   | Vd   | <b>D</b> 1 | <b>D2</b> | H    | Va   | Vd   | <b>D</b> 1 | <b>D2</b> | Н    |
| <b>S</b> 1   | 1    | 0.25 | 1          | 0.12      | 0    | 0.5  | 0.25 | 1          | 0.38      | 0.25 |
| S2           | 1.5  | 0.13 | 2.5        | 0.56      | 0.06 | 0.25 | 0.13 | 0.5        | 0.19      | 0.13 |
| S3           | 1.75 | 0.06 | 3.25       | 0.78      | 0.05 | 0.13 | 0.06 | 0.25       | 0.09      | 0.06 |
| S6           | 1.97 | 0.01 | 3.95       | 0.97      | 0.01 | 0.02 | 0.02 | 0.03       | 0.01      | 0.01 |
| $S_{\infty}$ | 2    | 0    | 4          | 1         | 0    | 0    | 0    | 0          | 0         | 0    |

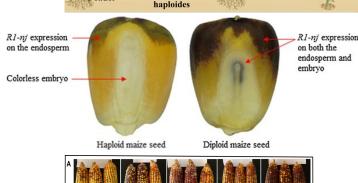

#### **Double-haploids**

- Advantages
- Reduce the time to obtain lines
- The unique method to achieve F = 1
- Conserve most of the parent's haplotypes

- Drawbacks
- It allows just one crossing-over
- There is no selection too much variability
- Lots of lines in the end
- Must be associated with Genomic selection
- Challenges
- Low induce rate
- The identification is time-consuming and subjective
- High costs to obtain the lines
- Patents

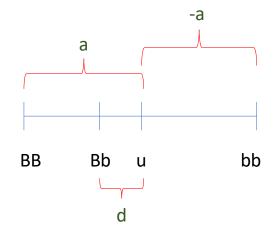

#### Should we select genotypes based on lines or hybrids?

- Average degree of dominance (add)
- add =  $d/a = \psi$
- Considering an F<sub>2</sub> population
- p = q = 0.5
- $\alpha = [a + (q p)d]$

• Va = 
$$2pq\alpha^2 = 2pqa^2 = \frac{1}{2}a^2$$
  $a = \sqrt{2. Va}$ 

• Vd = 
$$(2pqd)^2 = \frac{1}{4}d^2$$
  $d = \sqrt{4.Vd}$ 

$$add = \frac{d}{a} = \frac{\sqrt{4.Vd}}{\sqrt{2.Va}}$$

| 0           | Absence of dominance |  |  |  |
|-------------|----------------------|--|--|--|
| 0 < d/a < 1 | Partial dominance    |  |  |  |
| 1           | Complete dominance   |  |  |  |
| >1          | Overdominance        |  |  |  |

#### Correlation between lines and hybrids

$$r_{L,H} = \frac{\sigma_{LH}}{\sigma_L \ \sigma_H}$$

- Line
- $G_{ii} = \boldsymbol{\alpha}_i + \boldsymbol{\alpha}_i + \boldsymbol{S}_{ii}$
- Hybrid
- $G_{ij} = \boldsymbol{\alpha}_i + \boldsymbol{\alpha}_j + \boldsymbol{S}_{ij}$
- Genetic variance among lines
- $VgL = E[G_{ii} E(G_{ii})]^2$
- =  $E[u + \alpha_i + \alpha_i + S_{ii} u]^2$
- =  $E[2\alpha_i + S_{ii}]^2$
- =  $E[2\boldsymbol{\alpha}_i]^2 + 2E[\boldsymbol{\alpha}_i\boldsymbol{S}_{ii}] + E[\boldsymbol{S}_{ii}]^2$
- =  $4E[\boldsymbol{\alpha}_i]^2 + 2E[2\boldsymbol{\alpha}_i\boldsymbol{S}_{ii}] + E[\boldsymbol{S}_{ii}]^2$
- =  $4E[\boldsymbol{\alpha}_i]^2 + 4E[\boldsymbol{\alpha}_i \boldsymbol{S}_{ii}] + E[\boldsymbol{S}_{ii}]^2$
- = 2Va + 4D1 + D2

- Genetic variance among single-crosses
- $VgH = E[G_{ij} E(G_{ij})]^2$
- $= E[u + \boldsymbol{\alpha}_i + \boldsymbol{\alpha}_j + \boldsymbol{S}_{ij} u]^2$
- =  $E[\alpha_i + \alpha_i + S_{ii}]^2$
- $= E[\boldsymbol{\alpha}_i]^2 + E[\boldsymbol{\alpha}_i]^2 + E[\boldsymbol{S}_{ii}]^2 + ...$
- $= E[\boldsymbol{\alpha}_i]^2 + E[\boldsymbol{\alpha}_i]^2 + E[\boldsymbol{S}_{ii}]^2$
- =  $\frac{1}{2}$ Va +  $\frac{1}{2}$ Va + Vd
- = Va + Vd
- Covariance between lines and single-crosses
- $COV_{(L,H)} = E[G_{ij} E(G_{ij})] \cdot E[G_{ii} E(G_{ii})]$
- =  $E[\alpha_i + \alpha_i + S_{ii}] \cdot E[2\alpha_i + S_{ii}]$
- =  $2E[\alpha_i]^2 + E[\alpha_i S_{ii}] +$
- $2E[\boldsymbol{\alpha}_{i}\boldsymbol{\alpha}_{j}] + 2E[\boldsymbol{\alpha}_{j}\boldsymbol{S}_{ii}] + 2E[\boldsymbol{\alpha}_{j}\boldsymbol{S}_{ii}] + 2E[\boldsymbol{\alpha}_{i}\boldsymbol{S}_{ij}] + 2E[\boldsymbol{S}_{ii}\boldsymbol{S}_{ij}]$
- =  $2E[\boldsymbol{\alpha}_i]^2 + E[\boldsymbol{\alpha}_i S_{ii}]$
- = Va + D1

#### Correlation between lines and hybrids

$$r_{L,H} = \frac{\sigma_{LH}}{\sigma_{L} \sigma_{H}}$$

$$r_{L,H} = \frac{Va + D1}{\sqrt{(2Va + 4D1 + D2)(Va + Vd)}}$$

$$r_{L,H} = \frac{Va}{\sqrt{(2Va)(Va + Vd)}}$$

$$r_{L,H} = \frac{Va}{\sqrt{(2Va)(Va + \psi Va)}}$$

$$r_{L,H} = \frac{Va}{\sqrt{(2Va)Va(1+\psi)}}$$

• 
$$F_2 = D1 = D2 = 0$$

• 
$$\psi = Vd / Va$$

$$r_{L,H} = \frac{Va}{Va\sqrt{2(1+\psi)}}$$

$$r_{L,H} = \frac{1}{\sqrt{2\left(1 + \psi\right)}}$$

• Vd = 0; 
$$\psi$$
 = 0

• 
$$r_{\rm L, H} = 0.71$$

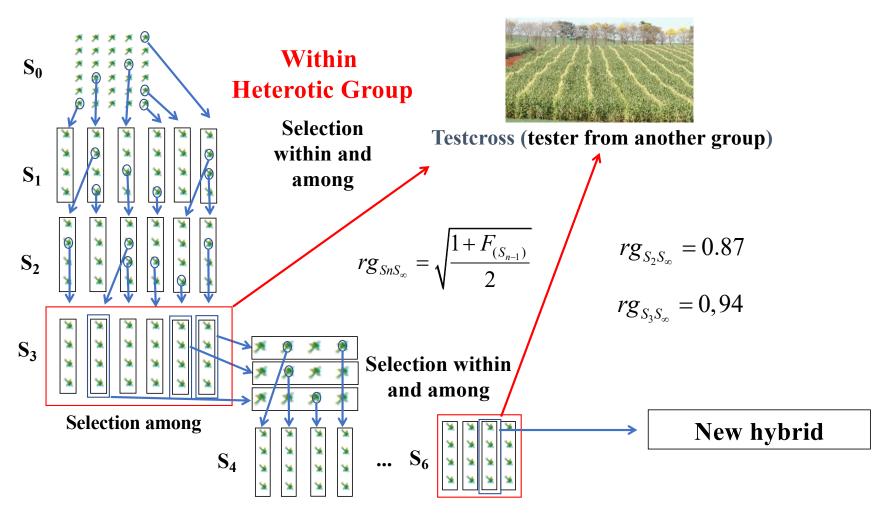

• 
$$Vd = 0$$
;  $\psi = 0$   
•  $Vd / Va = \psi = \frac{1}{2}$   
•  $Vd / Va = \psi = 1$   
•  $r_{L, H} = 0.71$   
•  $r_{L, H} = 0.58$ 

• 
$$r_{\rm L, H} = 0.58$$

• Vd / Va = 
$$\psi$$
 = 1

• 
$$r_{L, H} = 0.50$$

# **Obtaining lines – Early testcross**

#### **Early testcross**

$$r_g = \frac{COV \ testcross(g, g')}{\sqrt{V_T g. V_T g'}}$$

$$V_T g = \frac{1}{2} pq[1 + Fg]\alpha_T^2$$

$$V_T g' = \frac{1}{2} pq[1 + Fg'] \alpha_T^2$$

$$COV_{Tg,g'} = \frac{1}{2}pq[1+Fg]\alpha_T^2$$

TABLE 4.2. Frequencies and testcross means of genotypes (F = inbreeding coefficient).

| Pop      | ulation   | Test             | cross pro     | Testcross        |                                    |  |
|----------|-----------|------------------|---------------|------------------|------------------------------------|--|
| Genotype | Frequency | $A_1A_1$         | $A_1A_2$      |                  | mean                               |  |
| $A_1A_1$ | $p^2+pqF$ | $p_T$            | $q_T$         |                  | $\mu_T{+}q\alpha_T$                |  |
| $A_1A_2$ | 2pq(1-F)  | $\frac{1}{2}p_T$ | $\frac{1}{2}$ | $\frac{1}{2}q_T$ | $\mu_T + \frac{1}{2}(q-p)\alpha_T$ |  |
| $A_2A_2$ | $q^2+pqF$ |                  | $p_T$         | $q_T$            | $\mu_T - p\alpha_T$                |  |

$$r_g = \sqrt{\frac{1+Fg}{1+Fg'}}$$
  $r_g = \sqrt{\frac{1+Fg}{2}}$ 

Normally, at the end we have Fg' = 1

| Early      | generation | Late Generation |  |  |  |
|------------|------------|-----------------|--|--|--|
| Plant      | Family     | Inbreds         |  |  |  |
| S0         | S1         | 0.71            |  |  |  |
| <b>S</b> 1 | S2         | 0.87            |  |  |  |
| S2         | S3         | 0.94            |  |  |  |
| S3         | S4         | 0.97            |  |  |  |

# Selecting for combining ability

- Increase the frequency of favorable alleles in lines
- Ideal tester:
- *Elite line* = *produce the new hybrid*
- Single cross = produce a three-way cross hybrid

• 
$$CA_i = (C_i - C_{..}) = gi - \sum (p_i - p) \alpha_i^T$$

- Let's consider two different lines
- $g_1 \sum (p_1 p) \alpha_1^T$
- $g_2 \sum (p_2 p) \alpha_2^T$

• 
$$g_1 - g_2 = (p_1 - p) \alpha_1^T - (p_2 - p) \alpha_2^T$$

• 
$$g_1 - g_2 = (p_1 - p) \alpha_1^{\mathrm{T}} - (p_2 - p) \alpha_2^{\mathrm{T}}$$

$$\bullet \qquad = (p_1 - p_2) \, \mathbf{\alpha}^{\mathrm{T}}$$

• The difference is due to the frequency of favorable alleles

| Line  | f(B) | Line x tester | CA           |
|-------|------|---------------|--------------|
| L1    | p1   | C1            | CA1 = C1 - C |
| L2    | p2   | C2            | CA2 = C2 - C |
| L3    | p3   | C3            | CA3 = C3 - C |
| • • • |      | •••           | •••          |
| L100  | p100 | C100          | CA4 = C4 - C |
| Mean  | р    | C             |              |

# **Choosing testers**

E.g.,

d = 0.7

r = 0.6F = 1

- The best tester = correctly classifies the lines
- Normally, it comes from another heterotic group
- Should the tester be an elite or a poor line?
- Level of dominance and allele frequencies
- Consequences in breeding values

$$BV_i = (t_i - \bar{t})[a + (1 - 2r)d]$$

• genetic variability, and

$$\sigma_T^2 = \frac{1}{2}pq(1+F)[a+(1-2r)d]^2$$

• expected gain (unrelated tester)

$$\Delta_p = a + (1 - 2r)d$$

TABLE 4.2. Frequencies and testcross means of genotypes (F = inbreeding coefficient).

| Population |           | Test             | cross pro     | Testcross        |                                    |  |
|------------|-----------|------------------|---------------|------------------|------------------------------------|--|
| Genotype   | Frequency | $A_1A_1$         | $A_1A_2$      | $A_2A_2$         | mean                               |  |
| $A_1A_1$   | $p^2+pqF$ | $p_T$            | $q_T$         |                  | $\mu_T{+}q\alpha_T$                |  |
| $A_1A_2$   | 2pq(1-F)  | $\frac{1}{2}p_T$ | $\frac{1}{2}$ | $\frac{1}{2}q_T$ | $\mu_T + \frac{1}{2}(q-p)\alpha_T$ |  |
| $A_2A_2$   | $q^2+pqF$ |                  | $p_T$         | $q_T$            | $\mu_T - p\alpha_T$                |  |

$$BV_i = (t_i - \bar{t})[a - 0.28]$$

$$\sigma_T^2 = pq[a - 0.28]^2$$

$$\Delta_p = a - 0.14$$
